troysoft
for todays' recruiter

Features added to Troy Vision V3.0.43

Sales and Marketing Fields

It is now possible to configure the fields that are used within the sales and marketing tab of a call window. You can configure the fields in two places if you are logged into Troy as an administrator. The first place is within the division properties window and the second is within the sales and marketing tab, by clicking the **organise** button.

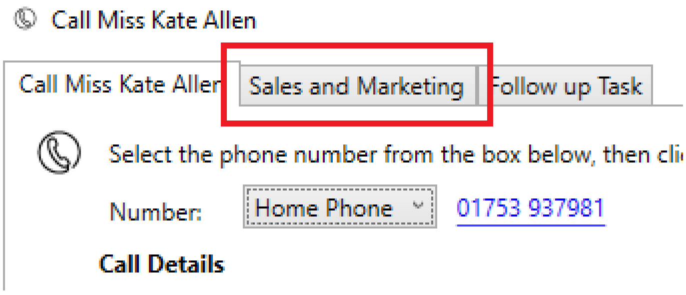

Figure 1 – the sales and marketing tab within a call window

Simply tick from the list of user and additional fields which fields are to be used, then click the **OK** button. *This button will read **Apply** if maintaining the fields via the division properties window so that you can change the fields for candidates and contacts at the same time.*

Drilling from job to candidate

A new setting has been added to the personal settings which controls whether the job is included in any call or note events created after you have drilled to the candidate from the job. If the job is associated with the call / note, then the candidate's status on the job will be changed according to the status selected against the event. By default, this feature is enabled but you can now turn it off via the People section of the personal settings.

Location format within web details of a job

Previous versions of Troy automatically placed the town of the job's location within the location field of the job's web details. A setting has been added to this version which allows you to choose how this field is initially populated (once populated you can change it). The new setting can be found within the settings window of the Web Manager. You can choose from not populating the field at all, just the town (which is the default), address, town, and postcode or address, town, postcode and country.

Other

A new system key has been introduced within the CV Scanning section of the Creation settings which controls whether Troy indexes the CV when a candidate has been created using it. Previously, the index would always occur which could slow down the creation operation. The indexing of the CV is required in order to perform text searches upon it. If not done when the candidate is created, it can be done retrospectively within the candidate / contact page, or via the Command Centre as a timed process.
